What is a key card hotel energy-saving switch?

The key card hotel energy-saving switch is essential for the electronic hotel door lock system. Its primary function is to allow hotel guests to insert the room card into the power switch when entering the hotel room after obtaining the room card from the front desk. Then, they can use the electrical equipment in the room.

How a hotel energy-saving key card system works?

Generally, the hotel energy-saving key card system comprises three parts: high and low-voltage power conversion, identification card, and output. There are many power conversion ways, such as switching power supply, resistance-capacitance step-down, transformer, etc.

How a dedicated RFID card works in a hotel?

More dedicated RFID cards are used to get electricity from the hotel energy-saving switch to achieve energy efficiency in hotels. Only by inserting the dedicated card that matches the hotel room door to get electricity can the same card be realized to open the door and get electricity.

Can a 12kHz key card switch be used in a hotel room?

The 13.56 MHz key card switch can only be used in hotel rooms that use the Mifare card hotel lock system and can only read the Mifare room card. The 12Khz key card power switch can only be used in hotel rooms that use Temic or ID card hotel lock systems and can only read 125Khz room cards.

What are the benefits of hotel energy-saving solutions?

The hotel energy-saving solutions can not only bring direct economic benefits to the hotel (saving significant amounts of electricity bills), extend the life of the room electrical appliances, improve the safety factor of the room electricity,

What is a power hotel energy-saving switch?

The power hotel energy-saving switch is a product specially designed for various hotels, motels, apartments, and office buildings. It is mainly used to solve the problem of cutting off the power supply when no one is in the hotel room to achieve electrical safety and energy saving.

?: Rechargeable room-temperature sodium-sulfur (Na-S) and sodium-selenium (Na-Se) batteries are gaining extensive attention for potential large-scale energy storage applications owing to their low cost and high theoretical energy density.
