How to solve SoC imbalance problem in battery cells?

In , the battery cells' SOC imbalance issue is solved by automatically adjusting each cell's discharge/charge rate while maintaining a regulated dc bus voltage. However, the energy interaction between the storage units is neglected.

Why is SOC equilibrium not achieved in light-load conditions?

Although the output power has been adjusted according to the SOC of each energy storage unit,there is no negative power flowin any unit,which means there is no energy interaction among the storage units,leading to a slow balancing process. Consequently,with the given light-load condition,the SOC equilibrium is not achieved until t = 200 s.

Do energy storage units have bi-directional regulation ability?

1. Introduction. Microgrids are clusters of distributed energy resources, energy storage units and loads, which are generally categorized into alternating current type and direct current type [1], [2], [3].Due to the inherent advantages of avoiding the enormous challenges, such as skin effect, harmonics, bus frequency control, and reactive power regulation, the DC ...

The SOC imbalance compensation alters the energy storage unit virtual droop resistance according to the difference between the unit SOC and the microgrid average SOC, thus the compensation intensity is dependent on the imbalance level being suitable to be employed in dc bus signaling controlled microgrids.

Battery energy storage systems (BESSs) typically have lower energy storage capacities than other forms of stored energy (e.g., pumped hydro storage), so it is important that battery state of charge is effectively managed to ensure that charge/discharge capacity is available when required [1].This is particularly important when BESSs are relied upon for the ...
