What is gravity energy storage technology (SGES)?

gravity energy storage technology (SGES)). to store or release electricity. This technology accomplishes energy storage by converting the electrical energy in the power system to the gravitational potential energy of the weight through electromechanical equipment.

Does solid gravity energy storage have a decision tree?

The decision tree is made for different technical route selections to facilitate engineering applications. Moreover, this paper also proposed the evaluation method of large-scale energy storage technology and conducted a comparative analysis of solid gravity energy storage with other large-scale energy storage technologies.

What is solid gravity energy storage?

They can be summarized into two aspects: principle and equipment. As for the principle, although each technological route lifts heavy objects in different ways (e.g., using ropes, carriers, or water currents), they all do so by lifting heavy objects to store electrical energy. This is the reason why they are all called solid gravity energy storage.

What are the advantages of solid gravity energy storage technology?

Solid gravity energy storage technology has the potential advantages of wide geographical adaptability, high cycle efficiency, good economy, and high reliability, and it is prospected to have a broad application in vast new energy-rich areas.

What is the cycle efficiency of solid gravity energy storage (SGES)?

The motor-generation unit is the energy conversion hub of solid gravity energy storage, which directly determines the cycle efficiency of solid gravity energy storage technology. The current efficiency of motor-generation units is about 90 %, so SGES's cycle efficiency is around 80 %.

How many technical routes does solid gravity energy storage technology have?

Solid gravity energy storage technology has as many as eight technical routes. Although the technical routes are different, some essential features are the same. They can be summarized into two aspects: principle and equipment.

It is worth mentioning that for the LCC evaluation of gravity energy storage system, the replacement and disposal/recycling costs are typically neglected due to the absence of demonstration plants [23]. A discount rate of 6% is used in the calculation of the net present value of the system over its lifetime [23].
