

Human-specific energy storage material

Can human body energy be used to charge wearable electrochemical storage devices?

Human beings are living on sunlight-radiated earth, thus, harvesting energy from sunlight is a good compensation for human-body energy to charge wearable electrochemical storage devices, especially considering each human-body energy harvester requires specific conditions to deliver the best power output.

What is electrochemical energy storage?

Electrochemical energy storage devices can accumulate the irregular or unstable harvested energy for use as stable power sources for wearable or implantable electronics. To be well-integrated with human-body energy harvesters, wearable SCs and batteries need to be conformal to the soft human body or organs.

Can flexible electrochemical energy storage devices be self-sustainable?

Charging flexible electrochemical energy storage devices by human-body energy (body motion, heat, and biofluids) is becoming a promising method to relieve the need of frequent recharging, and, thus, enable the construction of a self-sustainable wearable or implantable system including sensing, therapy, and wireless data transmission.

What are the different types of energy storage materials?

Based on the condition of the energy storage material, Socaciu's review divides SHS generally into two categories: sensible liquid storage and sensible solid storage (Fig. 11). While sensible liquid storage makes use of liquids like water or molten salts, sensible solid storage makes use of materials like rocks or soil.

Are wearable energy storage devices compatible with human-body energy harvesters?

In this article, we review the advances in the design of sustainable energy storage devices charged by human-body energy harvesters. The progress in multifunctional wearable energy storage devices that cater to the easy integration with human-body energy harvesters will be summarized.

What is underground thermal energy storage (SHS)?

Because they employ underground storage media, underground thermal energy storage (UTES) systems like aquifer, borehole, and cavern TES are also included in the SHS system classification. The main benefit of SHS is its infinite life cycle and fully reversible charging and discharging of the storage material.

In the past few decades, electricity production depended on fossil fuels due to their reliability and efficiency [1]. Fossil fuels have many effects on the environment and directly affect the economy as their prices increase continuously due to their consumption which is assumed to double in 2050 and three times by 2100 [6]. Fig. 1 shows the current global ...
