

Is hydrogen transport via pipeline energy efficient?

Hereby, the energy efficient design and the environmental performance of hydrogen transport via pipeline are examined by using thermodynamic pipeline models in the modelling and simulation tool Dymola and the methodology of LCA. In previous cited studies, the scope was often limited to medium-scale pipelines with diameters of up to 400 mm.

Can hydrogen be transported through pipelines?

Pipeline transmission appears to be the most economical means of transporting large quantities of hydrogen over great distances. However, before hydrogen can be widely used, a new network of pipelines will have to be constructed to ensure its transport.

What is a hydrogen pipeline?

Pipelines with operating pressures of up to 100 bar can be suited to connect the hydrogen producer, the consumer and the storage facilities as well. For thermodynamic modelling of hydrogen compression and transport, thermophysical property data need to be employed.

How does hydrogen affect a pipeline?

The main challenge in introducing hydrogen into existing pipelines is the significant difference in specific volume between hydrogen and natural gas, which reduces mass flow rate and transmitted energy. Hydrogen's lower viscosity and density affect its flow velocity, turbulence, and pressure distribution within the pipeline network.

Can natural gas pipeline infrastructure be used for hydrogen transport?

The use of the natural-gas pipeline infrastructure for hydrogen transport in a changing market structure. Int. J. Hydrogen Energy 2007, 32, 1381-1386. (67)Huang, M.; Wu, Y.; Wen, X.; Liu, W.; Guan, Y. Feasibility analysis of hydrogen transport in natural gas pipeline. Gas & Heat 2013, 33, 39-42.

What is the energy transition with Hydrogen pipes?

Energy transition with hydrogen pipes: Mannesmann "H2ready" and the changeover of existing Gasunie natural gas networks Pure hydrogen will be one of the main energy carriers in the changeover of the primary energy supply to renewable energy sources.

mediate storage medium for excess energy. None of the other energy storage technologies is technically or economically capable of coping with the amount of energy and storage duration involved [3]. Hydrogen can then be used to fill the supply gap in times of primary energy shortfall. In addition, hydrogen is also capable of serving the heat ...

Dihydrogen (H<sub>2</sub>), commonly named "hydrogen", is increasingly recognised as a clean and reliable energy vector for decarbonisation and defossilisation by various sectors. The global hydrogen demand is projected to increase from 70 ...

The storage of hydrogen is thus the storage of energy. The need for such storage is determined by the imbalance between energy production and its consumption. ... Another problem that might cause some difficulties is related to the leakage of hydrogen through pipe walls. The permeation rate for hydrogen is about four to five times higher than ...

A key step towards achieving these climate targets is the development of a so-called hydrogen economy, i.e. the reduction of GHG emissions by producing climate-friendly hydrogen and implementing it as energy carrier, commodity, and feedstock in the most energy-intensive sectors [4]. Worldwide, about 120 Mt/a of hydrogen were produced in 2020 [5] ...

Developing Hydrogen Infrastructure. As promising as a hydrogen-fueled future looks, there are still significant obstacles to overcome. Large-scale adoption of hydrogen into our energy systems calls for safe and cost-efficient infrastructure for its storage and transport. As pointed out by the IEA, "high initial capital costs and associated investment risks can therefore ...

Thanks to the advantages of cleanliness, high efficiency, extensive sources, and renewable energy, hydrogen energy has gradually become the focus of energy development in the world's major economies. At ...

The technical aspects and economics of bulk hydrogen storage in underground pipes, lined rock caverns (LRC) and salt caverns are analyzed. Hydrogen storage in underground pipes is more economical than in geological caverns for useable amounts <20-t-H<sub>2</sub>. However, because the pipe material is a major cost factor, the capital and operating costs for this ...
