Such a thermal storage method is simple and low-cost; however, the material has low thermal conductivity, so when energy is released, the thermal release capacity is low. In addition, such materials have low energy-storage density, leading to large sizes of the respective devices. Thus its industrial application value is yet to be improved.

For a higher-grade thermal energy storage system, the heat of compression is maintained after every compression, and this is denoted between point 3-4, 5-6 and 7-8. The main exergy storage system is the high-grade thermal energy storage. The reset of the air is kept in the low-grade thermal energy storage, which is between points 8 and 9.
