

PVDF-based materials have gained significant attention in the field of dielectric energy storage due to their excellent breakdown strength and energy storage density. However, the improvement has been limited by their low dielectric constant. In this article, the PVDF-TrFE composite films with core-shell structured  $(1-x)\text{Ba}(\text{Ti}_{0.8}\text{Zr}_{0.2})\text{O}_3-x(\text{Ba}_{0.7}\text{Ca}_{0.3})\text{TiO}_3@ \text{TiO}_2(\text{BZT}) \dots$

Novel PVDF-TrFE/ZnO quantum dot (QD) nanocomposite films stabilized with organic ligands (TEA) were fabricated using a spin-coating technique by varying the filler composition in the range of; 0, 0.15, 0.25, 0.35 and 0.50 % by weight with a thickness of 200-300 nm. ... The energy storage performance of the P(VDF-TrFE)/ZnO QD nanocomposite and ...

Doping the PVDF-TrFE composite film with 3 wt% BZT-0.6BCT increased its energy storage density to 14.2 J/cm<sup>3</sup>. When the doped ceramic fibers were coated with the TiO<sub>2</sub> core-shell of ~75 nm, the composite film ...

The total content of the filler space remains unchanged at 4 vol.%, which is the best content of single-layer performance. The study found that the PGD structure has better energy storage performance than the IGD ...

The results showed that when the content of SiO<sub>2</sub>@SrTiO<sub>3</sub> was 2.5 vol %, the optimal energy storage performance of the nanocomposite was 11.42 J/cm<sup>3</sup>, and the efficiency at 350 MV/m was 55.04%. In addition, Zhang et al. [ 83 ] developed a core-shell structure of BaTiO<sub>3</sub>@Ag fibers by using coaxial electrospinning and calcination technology.

Consequently, the energy storage performance of the terpolymer can be improved by blending with a small amount of PMMA. 1 Introduction. High-energy-density dielectric materials are needed to reduce the size or weight of capacitors, which are critical components for some pulsed power systems and power electronics [1, 2]. The energy density of a ...

For instance, in terms of dielectric behavior, the high energy density obtained from PVDF-TrFE is normally accompanied with a high loss factor and leakage current due to the ferroelectric nature of the polymer, resulting in poor charge-discharge efficiency when used in ...

The optimized energy storage density of 12.32 J/cm<sup>3</sup> and an efficiency of 64.87% are obtained in the SiO<sub>2</sub>-2h/PVTC/BZT-1h/PVTC/SiO<sub>2</sub>-2h multilayer composite films. The INL forms an interfacial barrier layer at the ...

The energy storage property was also improved with increasing BZT, the optimized energy storage property was obtained in x = 0.20 sample with W = 1.69 J/cm<sup>3</sup> at 17.5 kV/mm, which was superior to ...

The growing field of ferroelectric polymer-based nanocomposite has stimulated significant research activities in both academia and industry for devices with improved energy storage performance. Numerous studies, particularly on PVDF-based nanocomposite thin films, have been conducted, often reporting energy storage characteristics for sample ...

With the decrease of ZnO nanoparticle size, the energy storage level of piezoelectric film increases linearly. However, ... With the increase of nanometer ZnO content, the output performance of PVDF-TrFE/nano-ZnO piezoelectric sensor first increased and then decreased, which is consistent with the rule of basic parameters measured by PVDF-TrFE ...

The widely accepted concept for improving the energy storage performance of PVDF-based dielectric polymers is the reduction of the polarity of the crystal domains to enhance the applied electric field and a decrease in the ...

The increasing energy problem and the demand of environmental protection raise higher requirements for the development of clean energy. Dielectric capacitors have attracted lots of attention as a supporting ...

The total content of the filler space remains unchanged at 4 vol.%, which is the best content of single-layer performance. The study found that the PGD structure has better energy storage performance than the IGD structure composite dielectrics. The 3-5-3 PGD structure composite can obtain a maximum energy storage density of 12.93 J/cm<sup>3</sup>. This ...

Doping the PVDF-TrFE composite film with 3 wt% BZT-0.6BCT increased its energy storage density to 14.2 J/cm<sup>3</sup>. When the doped ceramic fibers were coated with the TiO<sub>2</sub> core-shell ...

PVDF-TrFE films with 0.1 wt.% AGO demonstrate voltage coefficient, energy density, and energy-harvesting figure of merit values of 0.30 V/m, 4.75 J/cm<sup>3</sup>, and 14 pm<sup>3</sup>/J, respectively, making it outstanding ...
