Three-level bi-directional buck-boost converter has the advantages of low voltage stress of the switches and low current ripples. This paper presents a capacitor voltage balancing method of a three-level bi-directional buck-boost converter for battery energy storage system. Classic phase-shifted PWM method is used to control this converter and all the switches are operated at the ...

An alternative solution is using a dc link active power filter (APF) to direct the pulsating power into another energy-storage component. The main dc link filter capacitor can then be reduced ...

In the traditional energy storage systems consisting of series connected energy storage cells such as electric double-layer capacitors (EDLCs), not only a bidirectional PWM converter but also a ...

In the proposed method, the pulsating power is absorbed by inductive auxiliary energy storage. This solution makes the use of smaller capacitor with suitable properties at the DC side.

To improve the power density of a single-phase rectifier, it is essential to reduce the dc-link capacitor required for filtering the low-frequency ripple energy. A bidirectional buck-boost converter is connected at the output of the typical single phase PWM rectifier. An auxiliary capacitor with capacitance Cs is used as an energy storage element.

Power systems for exploration rovers tend to be complex as three separate converters are necessary; in

This paper proposes the pulse width modulation (PWM) converter integrating voltage equalizers for PV modules and energy storage cells. The proposed integrated converter comprises a switched capacitor converter, PWM buck converter, and series-resonant voltage multiplier that perform PV equalization, power conversion from the PV modules to the ...

This research explores an improved operation of a recently studied converter, the so-called two-phase sixth-order boost converter (2P6OBC). The converter consists of a symmetric design of power stations followed by an ...

This paper studies the energy storage capacitor reduction methods for single phase rectifiers. The minimum ripple energy storage requirement is derived independent of a specific topology. ...

Single-phase pulsewidth modulation rectifiers suffer from ripple power pulsating at twice the line frequency. The ripple power is usually filtered by a bulky capacitor bank or an LC branch, resulting in lower power density. The alternative way is active power decoupling, which uses an active circuit to direct the pulsating power into another energy-storage component. ...

A small film capacitor is used as pulsating energy buffer in ac side, which not only improves the reliability but also the efficiency. A novel vector PWM for this topology is also proposed to maximize the dc voltage utilization, and to achieve the independent controls of the inverter output power and power decoupling.
