In this context, the progress in corresponding energy storage materials and systems stands as a fundamental prerequisite. Supercapacitors (SCs), known for their high-power densities, long life cycles, rapid charge/discharge rates, and wide operating temperature ranges, hold great promise as energy storage devices [1].

MIT engineers have created a "supercapacitor" made of ancient, abundant materials, that can store large amounts of energy. Made of just cement, water, and carbon black (which resembles powdered charcoal), the device could form the basis for inexpensive systems that store intermittently renewable energy, such as solar or wind energy.
