

When a material is plastically deformed the majority of mechanical work is dissipated as heat, and the fraction of plastic work converted into heat is known as the Taylor-Quinney coefficient (TQC). Large-scale molecular dynamics simulations were performed of high strain rate compression of single-crystal tantalum, and the resulting integral and differential ...

This paper reviews energy storage systems, in general, and for specific applications in low-cost micro-energy harvesting (MEH) systems, low-cost microelectronic devices, and wireless sensor networks (WSNs). With the development of electronic gadgets, low-cost microelectronic devices and WSNs, the need for an efficient, light and reliable energy ...

o Thermal Energy Storage Super Critical CO₂ Energy Storage (SC-CCES) Molten Salt Liquid Air Storage o Chemical Energy Storage Hydrogen Ammonia Methanol 2) Each technology was evaluated, focusing on the following aspects: o Key components and operating characteristics o Key benefits and limitations of the technology

Tantalum, MLCC, and super capacitor technologies are ideal for many energy storage applications because of their high capacitance capability. These capacitors have drastically different electrical and environmental responses that are sometimes not explicit on datasheets or requires additional knowledge of the properties of materials used, to select the ...

In this study, tantalum network nanoparticles are prepared from a Ta₂O₅ + k Mg system via a liquid magnesium-controlled combustion reaction per-stoichiometric amounts of magnesium are used in the preparation of a reaction mixture to produce a liquid magnesium pool capable of lowering the combustion temperature and leading to the formation of Ta network ...

In the past few decades, electricity production depended on fossil fuels due to their reliability and efficiency [1]. Fossil fuels have many effects on the environment and directly affect the economy as their prices increase continuously due to their consumption which is assumed to double in 2050 and three times by 2100 [6] g. 1 shows the current global ...

This work reports the first study on sustainable [Gd/Ho/Dy] co-doped Ta₂O₅ semiconductor used in different microelectromechanical systems (MEMS). Lanthanide ternary doping effectively narrowed the energy bandgap and reduced the crystallite size from 43.34 to 29.8 nm. With the improved surface area and stability, the fabricated electro-catalysts excelled ...

the stored energy reflects changes in the defect microstructure, e.g., the distributions of dislocations, point defects, grain boundaries, stacking faults, deformation twins, etc. For most deformation conditions of interest though, both strain hardening and energy storage are mainly consequences of the multiplication and storage of dislocations.
