Writing recently in Nature, LaPotin et al. introduce a tandem photovoltaic cell that converts thermal radiation into electricity with efficiencies exceeding 40%, clearly surpassing the thermoelectric efficiency of steam turbines. The cell blurs the lines between solar and thermal photovoltaic technology and could help make solar energy more dispatchable.

In this paper, a pre-economic dispatching model is established for the large-scale energy storage, new energy cluster and thermal power system in multiple regions, aiming to achieve the self-balance of power and electricity within the region as far as possible, improve the level of new energy consumption, and reduce the power and power adjustment of thermal power on the ...

energy supply and demand, exploit the variable production of renewable energy sources (e.g. solar and wind), increase the overall effi ciency of the energy system and reduce CO 2 emissions. This brief deals primarily with heat storage systems or thermal energy storage (TES). An energy storage system can be described in

As renewable energy continues to gain popularity, the demand for energy storage technology has also increased. Energy storage technology allows for the storage of excess energy produced by renewable sources, such as solar and wind, for later use. Two popular energy storage technologies are thermal energy storage and batteries.
